XENI ON STELLAR · PROJECT PLAN

Project Plan

Delivery of the Stellar migration, staged across the Stellar Community Fund Integration Track's three tranches (~12 weeks total): prove the interactive flow on testnet, then the autonomous intent-based flow on testnet, then migrate the full 450,000+ wallet base and cut over to production. The design is described in the companion *Technical Architecture Document*.

Track Integration · 3 tranches

Timeline ~12 weeks

Scale 450K+ wallets

TIMELINE

Tranche	Milestone	Duration	Network
1	Interactive flow — build + test	5 weeks	testnet
2	Autonomous intent-based flow — build + test	3 weeks	testnet
3	Migrate 450,000+ wallets + production rollout	4 weeks	mainnet

MILESTONES

TRANCHE 1

Interactive flow — build + test on testnet

5 weeks

WHAT WE BUILD

- Stellar MCP boundary (replaces Hedera H-MCP): build/submit USDC transfers, **fee-bump** named-payer so the traveler holds no XLM, Horizon reads, idempotent submit (duplicate-tx recovery).
- **Human-in-the-loop** booking: the traveler picks a specific deal and authorizes it, signing with a Stellar wallet over WalletConnect; pay `user→treasury` in USDC. No price-target automation in this tranche.
- XeniPay `chains.BlockchainClient` Stellar adapter: `treasury→supplier` / commission settlement + trustlines.
- Hardened refund chain (`treasury→user`): bounded retry, duplicate-tx recovery via Horizon, ops reprocess — plus the audit envelope (→ Soroban events / tx memos).

REGISTERED FOOTPRINT — TESTNET

- USDC asset (SEP-41 SAC) on testnet as the settlement asset.
- Treasury + agent fee-payer accounts (testnet).
- First app-operated + sponsored test wallets.

Release criteria

The full interactive flow — **authorize → pay → settle → refund** — passes end-to-end on Stellar **testnet** (automated + manual QA); the Stellar MCP + chains adapter are open-sourced.

TRANCHE 2

Autonomous intent-based flow — build + test on testnet

3 weeks

WHAT WE BUILD

- **Rich intent model:** target price · specific dates · star-category hotel · distance from a point of interest. The agent monitors inventory + fares and books only when every constraint is met.
- Single-signature **Soroban SEP-41 allowance** (`user→agent`) at intent time; the agent then pays via `transfer_from` with **no second wallet popup**.
- Integrate the Built-on-Stellar **x402 Facilitator** as the autonomous payment rail over the same USDC.
- Close the loop: intent → monitor → all constraints met → pay within the signed ceiling → settle, enforced server-side.

REGISTERED FOOTPRINT — TESTNET

- Soroban allowance / settlement contract ID(s) on testnet.
- Agent x402 session accounts.

Release criteria

An autonomous intent — **target price, dates, star rating, distance from a landmark** — books and pays within the signed allowance, end-to-end on Stellar **testnet**, no human at checkout; the allowance + x402-on-Stellar pattern is open-sourced.

TRANCHE 3

Migrate 450,000+ wallets + production rollout

4 weeks

WHAT WE BUILD

- **Migrate the full 450,000+ wallet base** from Hedera to Stellar: provision Stellar accounts, establish USDC trustlines, and use **sponsored reserves** so no user needs XLM — reconciled against the Hedera balances.
- Production cutover of **both flows** (interactive + autonomous) to Stellar pubnet; retire the Hedera H-MCP and the Hedera settlement rail.
- SEP-24 / SEP-31 USDC anchoring for fiat on/off-ramp; observability (settlement latency, fee, allowance headroom, volume) + reconciliation dashboards.

REGISTERED FOOTPRINT — MAINNET

- USDC distribution + treasury + agent accounts on pubnet.
- Soroban contract ID(s) on pubnet; full production wallet set (450K+).
- Anchor integration.

On-chain metric threshold (panel-ratified)

Over a rolling 30-day window on pubnet: ≥ **450,000** wallets migrated to Stellar · ≥ **[N]** monthly-active traveler wallets transacting · ≥ **$[X]** USDC payment + settlement volume.

SCOPE & RATIONALE

REAL APP, REAL SCALE

450K+ wallets migrating

A built, two-mode travel-payment stack and a 450,000+ wallet user base move directly onto Stellar — not a prototype.

SOROBAN-NATIVE

Allowance + x402

Exercises SEP-41 allowances, the x402 Facilitator, sponsored reserves, and a purpose-built settlement contract.

REUSABLE

Open-source references

The Stellar MCP boundary, the settlement adapter, and the allowance + x402 agent pattern all ship open for other teams.

Open items for submission: the two Tranche 3 thresholds — **[N]** monthly-active wallets and **$[X]** volume (to be set from production data) — the per-tranche funding asks, and the team / eligibility (≥2 members for the SCF webinars + demo day) and KYC/KYB details.
